Conventional Approach to Measuring the Intergenerational Transmission of Family Influence

- IGE (intergenerational elasticity).
- Childhood is a single period stage of three-stage overlapping generations model followed by adulthood and retirement.
- Ignores uncertainty.
- Abstracts from timing considerations within stages of the life cycle.
- Focus: Realized lifetime incomes or welfare across generations, but uses snapshots of life cycles in practice due to data limitations.
- Implicitly invokes stationarity across generations or limited nonstationarity.

Eshaghnia, Heckman, Landersø, & Qureshi

Our Approach

- Also recognize powerful role of parental influence.
- Multiple periods within each stage of the life cycle.
- Recognize critical and sensitive periods for effective investment.
- Income realized over lifetimes is not the income and welfare **expected** at each period of the life cycle.
 - Information revealed within each stage.
 - Agents risk averse.
 - Credit constraints restrict the smooth transfer of income over the life cycle.
- Income expectations that govern child investment decisions not the same as the realizations of those expectations.
- A continuum of possible IGEs pairing different stages of parent and child life cycles.
- We pick IGEs of life-cycle measures that are most predictive of important childhood outcomes.

Data Measures

Life-Cycle Decision-Specific IGEs

- Account for fundamental nonstationarities of economic and social environments.
- Intergenerational changes in the patterns of educational attainment: main drivers of changes in life-cycle patterns of family formation.

What We Do

Eshaghnia, Heckman, Landersø, & Qureshi

.

Contributions

- Recognize importance of early years in shaping child development.
- Fundamental nonstationarity of life cycles across cohorts.
- Build and estimate a life-cycle model accounting for uncertainty and credit constraints.
- Measure role of uncertainty, education, and policy (*ex ante* vs. *ex post*).
- G Determine best predictors of successful childhoods.
- Age-specific life-cycle measures of social mobility that are most predictive of child outcomes.
- Surprisingly, the predictive power does not vary with the age of the child at which the life cycle measures are computed (but it does for snapshot measures).

Eshaghnia, Heckman, Landersø, & Qureshi

- Traditional proxy measures only weakly correlated with true lifetime measures.
- Life-cycle relative mobility < Proxy relative mobility (currently used proxies overstate relative mobility).
- Life-cycle absolute mobility > Proxy absolute mobility.
- Reforms in credit markets play a huge role in explaining IGE.
- Even in a generous welfare state with substantial social benefits and social insurance and redistribution through taxes and transfers, there is strong dependence in lifetime resource and welfare across generations.

Data Measure

App

Two Measures of Lifetime Resources and Well-Being

- **9** Present Discounted Value of Future Income (PDV).
- Lifetime Wealth: approximates lifetime value function and accounts for both uncertainty and liquidity constraints.

Eshaghnia, Heckman, Landersø, & Qureshi

Data	Measures	Nonstationarity	IGEs	Decomposing	Absolute	Conclusions	App

- Measures that predict important lifetime outcomes of children, like their participation in education and crime.
- Distinguish *ex post* and *ex ante* (realized vs. anticipated).

Data	Measures	Nonstationarity	IGEs	Decomposing	Absolute	Conclusions	App

- *Expected* income and expected well-being at different ages measure resources available for consumption and child investment at those ages.
- Measure of decision-relevant and age-specific welfare.

• Micro and full population register data.

Eshaghnia, Heckman, Landersø, & Qureshi

Measures

Figure 1: Data Availability and Our Sample of Parents and Children

Parent and Child income is averaged between ages 30-35, whenever available in register files

Measures

Measures of Lifetime Resources

Traditional

Measures

New Measures of Life-Cycle Resources and Welfare

Eshaghnia, Heckman, Landersø, & Qureshi

(1)

 $\text{PDV}_{i,t} = \mathbb{E}_{i,t} \left[\left. \sum_{\tau=1}^{T-t} \beta^{\tau} \mathbf{y}_{i,t+\tau} \right| \underbrace{\mathcal{I}_{i,t}}_{\substack{\text{Information} \\ \text{set for} \\ \text{individual } i \\ \text{in period } t}} \right]$

Eshaghnia, Heckman, Landersø, & Qureshi

- Approximate value function (Huggett and Kaplan, 2016).
- Expected lifetime wealth at period *t*:

$$LW_{i,t} = \mathbb{E}_{i,t} \left[\sum_{\tau=1}^{T-t} s_{i,t+\tau} y_{i,t+\tau} \middle| \mathcal{I}_{i,t} \right].$$
(2)

$$\mathbf{s}_{i,t+1} = \mathbb{E}_{i,t} \left[eta rac{U_c(\mathbf{c}_{i,t+1})}{U_c(\mathbf{c}_{i,t})} \mid \mathcal{I}_{i,t}
ight].$$

• Accounts for uncertainty and credit constraints.

Eshaghnia, Heckman, Landersø, & Qureshi

Measures

• Household Euler Equation:

$$\mathbb{E}_{i,t} \left[\beta \frac{U_{c}(c_{i,t+1})}{U_{c}(c_{i,t})} (1 + r_{i,t+1}) (1 + \lambda_{i,t}) \right] = 1.$$
(3)

• CRRA utility function:

$$\boldsymbol{U}(\boldsymbol{c}_{i,t}) = \frac{\boldsymbol{c}_{i,t}^{1-\rho} - 1}{1-\rho}.$$

Eshaghnia, Heckman, Landersø, & Qureshi

Data Measures

Identifying and Estimating Information Sets

- Cunha and Heckman (2016).
- Use information that predicts outcomes each period.

Eshaghnia, Heckman, Landersø, & Qureshi

Example of How We Select Information Sets

- $Y_t =$ outcome at t.
- I_t = relevant information known and acted on at t.
- $W_t = \text{not known and/or acted on at } t$.

$$\mathbf{Y}_t = \mathcal{I}_t \boldsymbol{eta} + \mathbf{W}_t \Gamma + \mathbf{U}_t$$

 $\mathbf{U}_t \perp \perp (\mathcal{I}_t, \mathbf{W}_t)$

• Test: \mathcal{I}_t properly specified if $\beta \neq 0$, $\Gamma = 0$.

•
$$U_{t+j} = Y_{t+j} - E(Y_{t+j} \mid \mathcal{I}_t), \quad j > 0.$$

- Correct information set: U_{t+j} not predicted by \mathcal{I}_t .
- New information arrives later.

Decomposing IGEs: The Crucial Role of Change in Educational Attainment across Cohorts

Eshaghnia, Heckman, Landersø, & Qureshi

• Regression specification:

$$\boldsymbol{y}_{i,t}^{k} = \lambda^{k} + (\boldsymbol{\beta}^{k})' \boldsymbol{X}_{i,t}^{k} + \mu_{i}^{k} + \epsilon_{i,t}^{k}.$$
(4)

- $k \in \{p, c\}$.
- Average log-income ages 30 to 35:

$$\overline{y}_i^k = \lambda^k + (\beta^k)' \overline{\mathbf{X}}_i^k + \mu_i^k + \overline{\epsilon}_i^k.$$

• Decompose intergenerational covariance of log-income into components:

$$\operatorname{Cov}(\overline{y}_{i}^{\mathsf{c}}, \overline{y}_{i}^{\mathsf{p}}) = \operatorname{Cov}\left((\beta^{\mathsf{c}})' \overline{\boldsymbol{X}}_{i}^{\mathsf{c}}, \overline{y}_{i}^{\mathsf{p}}\right) + \operatorname{Cov}(\mu_{i}^{\mathsf{c}}, \overline{y}_{i}^{\mathsf{p}}).$$
